STOP THIS INVADER!

The **SPOTTED LANTERNFLY** is an invasive insect that can be moved to new places, tucked away in landscape materials, outdoor furniture, firewood, and vehicles. It attacks many trees and crops and has the potential to damage our forests and food supply. **SPOTTED LANTERNFLY** feeds on many different plants, including Tree-of-Heaven, grapevines, peaches, black walnut, and other important trees.

Adult **SPOTTED LANTERNFLIES** are gray and black, and have hind wings with bright red patches. Adults are about an inch long and are present between July and December.

You can help stop this bad bug by learning about it and by using a checklist when moving, taking a day trip, or going camping to make sure the pest does not travel with you.

1. Learn about the life stages of Spotted Lanternfly by visiting: extension.psu.edu/spotted-lanternfly
 2. Before you travel, check for and destroy any Spotted Lanternflies that you find. See online Spotted Lanternfly Resident Checklist at extension.psu.edu/spotted-lanternfly.
 3. Tell your friends!
